

IAM (IDENTITY & ACCESS MANAGEMENT) in a little more detail...

Our portfolio of IAM solutions address requirements for small businesses through to large enterprises, who are looking to formulate a secure and auditable process for access to network systems/resources and cloud apps for both employees and customers.

What will Data Connect's approach be?

Our aim is to simplify management of this sometimes complex area across multiple applications and operating systems. The business is then able to easily define what resources and information individual employees and groups can access, whilst securing against unauthorised access by both internal and external sources. Full auditing and reporting should be readily available at any stage to ensure compliance. Keeping track of new employees, those that have left and new users groups in addition to performing password resets, should not impinge on vital IT resource.

What will we gain by involving Data Connect?

In short, we want to empower your business with seamless and secure employee access to authorised information, with easy means to audit information for compliance and manage change on an ongoing basis.

What will the benefit be to my business in real terms?

A successful project and implementation of the right technology can improve productivity, bolster current security and inevitably save your organisation money in operating costs.

It's important to me to have a strategy in place that's tailored to the particular challenges my business faces.

Please contact us to discuss your business processes, requirements and infrastructure in further detail and we will endeavour to streamline and develop your IAM policy with the relevant stakeholders in your business and position the technology solution that fits your needs.
