

PASSWORD MANAGEMENT AND SINGLE SIGN-ON

in a little more detail...

What challenges might my business face?

Access by employees to multiple business applications via a multitude of passwords can be frustrating and time consuming for employees, which often results in a drop in their productivity and an increased burden for your IT team. Conversely, weak passwords and an unstructured policy of enforcement/change can result in a serious 'weak spot' in your defences and information security procedures.

What solutions are available?

Single Sign-On (SSO) technologies make it possible for users to securely authenticate into all of their applications after providing their username and password just once, thus reducing the cost and effort of managing multiple usernames and passwords. For organisations looking to cut costs, or to encourage adoption and improve traffic to their platforms, SSO is an essential technology.

How can Data Connect help?

Our innovative solution portfolio also includes products that can continuously monitor and discover known and weak passwords across an array of applications/services and then changes each account's password to a unique and complex value. This ensures protection from hackers whilst facilitating seamless access to authorised and authenticated staff.

With the combination of professional advice and technology we are able to design a solution that secures your organisation with strong password policies and procedures. This facilitates fast and productive access to business systems and cloud apps for your employees on multiple devices and operating systems.

Can we meet face-to-face to discuss this in more detail?

No problem. Please contact us today to discuss your requirements and we'll be delighted to visit you at a convenient time to meet in person.
