

SECURE REMOTE ACCESS & TWO FACTOR AUTHENTICATION (2FA) in a little more detail...

Remote Access control is now imperative for the vast majority of businesses and to enable your staff to work flexibly from an array of different devices is essential, however not without technical complexity, security implications and risks.

How can Data Connect help?

For your workforce out on the road, working from home or connecting to network resources from a public place, Data Connect can advise on and provide your organisation with an SSL VPN secure remote access solution. Our range of solutions enable administrators to lock down specific resources to only authorised staff and provide powerful yet easy to use tools for overall management, whilst providing a familiar experience for the users.

What solutions do Data Connect recommend?

To counteract the threat of identity theft and weak passwords adopted by users, we recommend the adoption of a two factor authentication solution so remote users can conclusively verify they are legitimately accessing your corporate network and business resources. This is done by combining something they possess (usually in the form of a hardware token, mobile phone or smartphone which will provide a unique one time password) and something they know (in the form of a secret PIN or password) to generate a unique time sensitive passcode.

Data Connect can offer 2FA as either a stand alone hardware/software solution or alternatively, a fully managed and supported cloud service from an ISO 27001 provider that simplifies administration and alleviates the need for hardware/software procurement.

What's the next step?

Call us today to arrange an initial, without obligation consultation and we'll help you to evaluate areas of possible exposure to risk across your business both in and out of the office.
